INTRODUCTION

In 1986, Community Health prepared a report "Population Estimates and Projections for Health Units, 1981-1991", which was based on 1981 census data. Now 1986 health unit specific census information has become available and Alberta Bureau of Statistics (ABS) has produced a new set of projections for the province.

The purpose of this report is to provide population estimates and projections for Alberta health units based on the 1986 census information. The basic data required to derive these estimates and projections were provided by Alberta Bureau of Statistics upon special request. This information was used to construct the tables of population projections and graphs of population characteristics presented in this report.

Appendix A describes in detail the methods used in arriving at these projections, including a description of data sources and input assumptions. Appendices B, C and D include tables of the 1986 population census of each health unit, the population ratios of each health unit, and the Alberta series 5 population projection figures from 1987 to 1996 prepared by ABS. Appendix E explains the method of calculation of structural characteristics and growth of the population for the health units.

The report is organized alphabetically into 27 sections for each health unit. Each health unit section begins with 3 tables containing population estimates and projections for males, females and totals sorted by age-groups from 1987 to 1996. These tables are then followed by a table of structural characteristics and projected growth of the population for the health unit. The last part of each health unit section contains 2 graphs showing some of the structural population characteristics. Some of the limitations of the methodology and data are noted in the appendices. Such limitations should be given due attention when using the information provided in this report.

APPENDIX A

METHODOLOGY

1. Introduction

This appendix provides a detailed discussion of the method applied to calculate population estimates and projections by specified age-groups and sex for the 27 health units of Alberta. The reference date for these estimates and projections is July, 1988. The project was undertaken on behalf of Community and Occupational Health, now the Department of Health, to meet the special demands for small area demographic information.

2. Sources of Information

The information used for developing the population estimates and projections for the health units is from the following sources:

a) Alberta Bureau of Statistics

b) "Population Projections Alberta 1987 - 2016", from Alberta Treasury, Bureau of Statistics, published May, 1988

c) "Census Canada 1986, Summary Tabulations, Canada, Provinces and Territories", from Statistics Canada, catalogue no. 93-101, published July, 1987

The small areas undertaken in this project are the 27 health units which make up the province of Alberta. They are:

Name of Health Unit

Edmonton
Calgary
Alberta East Central
Athabasca
Banff National Park
Barons-Eureka-Warner
Big Country
Chinook
Lethbridge
Drumheller
Alberta West Central
Foothills
Fort McMurray
South Peace
High Level-Fort Vermilion
Jasper National Park
Leduc-Strathcona
Southeastern Alberta
Minburn-Vermilion
Mount View
North Eastern Alberta
Peace River
Red Deer Regional
Stony Plain-Lac Ste. Anne
Sturgeon
Vegreville
Wetoka

3. Methods of Projections

The population projections for the 27 Alberta health units for the years 1987 to 1996 were derived by using a ratio distribution technique based on the 1986 census. The projection procedures involved the following steps:

a) First, the population projection series 5 was obtained from "Population Projections Alberta 1987-2016" which was prepared by Alberta Bureau of

Statistics after the release of the 1986 Canada census figures. These projections are used as the first of two multipliers to derive final projections. Projection series 5, the medium growth series, was generated using the Bureau's computerized cohort-survival model. This model takes population in a base year and adds births and net migration while subtracting deaths to derive population in the following year. A more detailed explanation can be found in ABS report, "Population Projections, Alberta, 1987 - 2016".

b) Next, the 1986 population census (Appendix B) was used to construct population ratios for each health unit. These ratios were calculated by dividing each of the health unit populations by Alberta's population in 1986 for the specified age-groups. These ratios were then used as the second multiplier as described in step c.

c) Last, the final projected population by age-groups and sex for each health unit was derived by multiplying the population ratios (Appendix C) by the population from projection series 5 (Appendix D) for the years 1987 to 1996.

4. Limitations of Data

The population censuses for the 27 health units for each specific age group were those provided by ABS. Although the data can provide excellent information on population distribution, they are subject to the following constraint:

The source for the 1986 population census and the population projection series contains male and female population figures which have been rounded to the nearest 0 or 5. Therefore, in some cases the total figures do not always add up to the sum of males and females. This slight inaccuracy will cause the total population projection figures to be different than when adding male and female population projection figures together. Therefore, total population is not obtained by the method as described in section 3 but is simply derived by adding final male and female population projection figures together.

APPENDIX E

CALCULATION OF POPULATION CHARACTERISTICS

The 8 population characteristics for the health units were derived by the method of calculation below for the years 1986, 1991 and 1996 by using the 1986 population census figures (Appendix A), and the 1991 and 1996 population projection figures (Tables 1.1 to 27.3). The population growth percent change occurs for a 5 year time period rather than annually.

1. Sex Ratio $= \frac{\text{Total Male Population}}{\text{Total Female Population}} \times 100$

2. Young Age Dependency Ratio $= \frac{\text{Population 0 - 14}}{\text{Population 15 - 64}} \times 100$

3. Old Age Dependency Ratio $= \frac{\text{Population 65+}}{\text{Population 15 - 64}} \times 100$

4. Percent of Population 65+ $= \frac{\text{Population 65+}}{\text{Total Population}} \times 100$

5. Percent of Population 85+ $= \frac{\text{Population 85+}}{\text{Total Population}} \times 100$

6. Sex Ratio of Population 65+ $= \frac{\text{Male Population 65+}}{\text{Female Population 65+}} \times 100$

7. Sex Ratio of Population 85+ $= \frac{\text{Male Population 85+}}{\text{Female Population 85+}} \times 100$

8. Population Growth (% change from 1986 to 1991) $= \frac{\text{Population 1991 - Population 1986}}{\text{Population 1986}} \times 100$

   (% change from 1991 to 1996) $= \frac{\text{Population 1996 - Population 1991}}{\text{Population 1991}} \times 100$
